

## CLAIMS

1. (Currently Amended) A processor-readable computer-storage medium having storing processor-executable instructions that, when executed by a processor, perform[[s]] acts comprising:

obtaining a digital good;

partitioning the digital good into a plurality of regions;

calculating rational statistics of one or more the regions of the plurality, so that the statistics of a region are representative of the region, wherein the calculating comprises generating the rational statistics of one or more regions of the plurality via a hashing function having a quotient of two weighted, linear, statistical combinations and wherein the rational statistics are semi-global characteristics, wherein numerator of the quotient is a first of the two weighted, linear, statistical combinations and wherein the denominator of the quotient is a second of the two weighted, linear, statistical combinations not one;

quantizing the rational statistics;

marking the digital good with the quantized rational statistics of the plurality of the regions.

2. (Canceled)

3. (Canceled)

4. (Currently Amended) A medium as recited in claim 1, wherein ~~the~~ of the hashing function is represented by:

$$h_i = \frac{\sum_{j \in R_i} \alpha_{ij} s_j}{\sum_{j \in R_i} b_{ij} s_j}$$

where:

- $a_{ij}$  is the  $j^{\text{th}}$  element of  $a_i$  and  $a_i$  are a pseudo-random generated weight factors;
- $b_{ij}$  is the  $j^{\text{th}}$  element of  $b_i$  and  $b_i$  are a pseudo-random generated weight factors;

- $s$  denotes the digital good of dimension  $N \times 1$ ;
- $R_i$  are the plurality of regions, where  $R_i \subseteq \{1, 2, \dots, N\}$ .

5. (Original) A medium as recited in claim 1, wherein the partitioning comprises segmenting the digital good into a plurality of overlapped regions.

6. (Original) A medium as recited in claim 1, wherein the marking comprises embedding a watermark via quantization.

7. (Cancelled)

8. (Cancelled)

9. (Currently Amended) A ~~processor-readable medium~~ computer-storage media ~~having~~ storing processor-executable instructions that, when executed by a processor, perform[[s]] acts comprising  
obtaining a digital good; and  
using quantization, marking the digital good with a watermark, wherein such quantization is based upon semi-global characteristics of regions of the digital good, wherein such semi-global characteristics are generated via a hashing function employing a quotient of at least two weighted linear combinations of statistics of the regions of the digital good, wherein numerator of the quotient is a first of the two weighted, linear, statistical combinations and wherein the denominator of the quotient is a second of the two weighted, linear, statistical combinations not one.

10-12. (Cancelled)

13. (Currently Amended) A system for facilitating the protection of digital goods, the system comprising:

a partitioner configured to segment a digital good into a plurality of regions;

a region-statistics calculator configured to calculate rational statistics of one or more of the plurality of regions, wherein the statistics of a region are representative of that region, wherein the region-statistics calculator is further configured to generate the rational statistics of one or more regions of the plurality via a hashing function having a quotient of two weighted, linear, statistical combinations and wherein the rational statistics are semi-global characteristics, wherein numerator of the quotient is a first of the two weighted, linear, statistical combinations and wherein and the denominator of the quotient is a second of the two weighted, linear, statistical combinations not one;

a region quantizer configured to quantize the rational statistics of a region; and

a digital-goods marker configured to generate a marked good using the quantized rational statistics.

14. (Original) A system as recited in claim 13, wherein the region-statistics calculator is further configured to generate the rational statistics of one or more regions of the plurality via a hashing function.

15. (Canceled)

16. (Original) A system as recited in claim 13, wherein the partitioner is further configured to segment a digital good into a plurality of overlapping regions.

17. (Currently Amended) A system as recited in claim 13, wherein  $h$  of the hashing function is represented by:

$$h_i = \frac{\sum_{j \in R_i} \alpha_{ij} s_j}{\sum_{j \in R_i} b_{ij} s_j}$$

where:

- $a_{ij}$  is the  $j^{\text{th}}$  element of  $a_i$  and  $a_i$  are a pseudorandom generated weight factors;
- $b_{ij}$  is the  $j^{\text{th}}$  element of  $b_i$  and  $b_i$  are a pseudorandom generated weight factors;
- $s$  denotes the digital good of dimension  $N \times 1$ ;

- $R_i$  are the plurality of regions, where  $R_i \subseteq \{1, 2, \dots, N\}$ .

18. (Currently Amended) A ~~processor-readable~~ computer-storage medium ~~having~~ storing processor-executable instructions that, when executed by a processor, perform[[s]] acts comprising:

obtaining a digital good;

partitioning the digital good into a plurality of regions, wherein the partitioning comprises segmenting the digital good into a plurality of overlapped regions;

calculating rational statistics of one or more the regions of the plurality, so that the statistics of a region are representative of the region, wherein the rational statistics are semi-global characteristics;

quantizing the rational statistics;

marking the digital good with the quantized rational statistics of the plurality of the regions, wherein the marking comprises embedding a watermark via quantization,

wherein the calculating comprises generating the rational statistics of one or more regions of the plurality via a hashing function,  $h$ , that hashing function having quotient of two weighted, linear, statistical combinations, and where

$$h_i = \frac{\sum_{j \in R_i} \alpha_{ij} s_j}{\sum_{j \in R_i} b_{ij} s_j}$$

where:

- $\alpha_{ij}$  is the  $j^{\text{th}}$  element of  $\alpha_i$  and  $\alpha_i$  are a pseudo-random generated weight factors;
- $b_{ij}$  is the  $j^{\text{th}}$  element of  $b_i$  and  $b_i$  are a pseudo-random generated weight factors;
- $s$  denotes the digital good of dimension  $N \times 1$ ;

$R_i$  are the plurality of regions, where  $R_i \subseteq \{1, 2, \dots, N\}$ .
